The codedescribe and codelisting Packages Version 1.10

Alceu Frigeri*

June 2025

Abstract

This package is designed to be as class independent as possible, depending only on expl3, scontents, listing and pifont. Unlike other packages of the kind, a minimal set of macros/commands/environments is defined: most/all defined commands have an "object type" as a keyval parameter, allowing for an easy expansion mechanism (instead of the usual "one set of macros/environments" for each object type).

No assumption is made about page layout (besides "having a marginpar"), or underlying macros, so that it can be used with any document class.

		•

1 Introduction

This package aims to document both Document level (i.e. final user) commands, as well Package/Class level commands. It's fully implemented using expl3 syntax and structures, in special 13coffins, 13seq and 13keys. Besides those scontents and listing packages (see [1] and [2]) are used to typeset code snippets. The package pifont is needed just to typeset those (open)stars, in case one wants to mark a command as (restricted) expandable.

No other package/class is needed, any class can be used as the base one, which allows to demonstrate the documented commands with any desired layout.

codelisting defines a few macros to display and demonstrate LATEX code (using listings and scontents), whilst codedescribe defines a series of macros to display/enumerate macros and environments (somewhat resembling the doc3 style).

^{*}https://github.com/alceu-frigeri/codedescribe

1.1 Single versus Multi-column Classes

This package "can" be used with multi-column classes, given that the \linewidth and \columnsep are defined appropriately. \linewidth shall defaults to text/column real width, whilst \columnsep, if needed (2 or more columns) shall be greater than \marginparwidth plus \marginparsep.

1.2 Current Version

This doc regards to *codedescribe* version 1.10 and *codelisting* version 1.10. Those two packages are fairly stable, and given the $\langle obj-type \rangle$ mechanism (see 3.2) they can be easily extended without changing their interface.

2 codelisting Package

It requires two packages: listings and scontents, defines an environment: codestore, commands for listing/demo code: \tscode, \tsmergedcode, \tsdemo, \tsresult and \tsexec and 2 auxiliary commands: \setcodekeys and \setnewcodekey.

2.1 In Memory Code Storage

Thanks to scontents (expl3 based) it's possible to store \mathbb{E}_{EX} code snippets in a expl3 sequence variable.

<u>codestore</u> \begin{codestore} [$\langle tcontents-keys \rangle$]

\end{codestore}

This environment is an alias to scontents environment (from scontents package, see [1]), all scontents keys are valid, with two additional ones: st and store-at which are aliases to the store-env key. If an "isolated" $\langle st-name \rangle$ is given (unknown key), it is assumed that the environment body shall be stored in it (for use with \tscode, \tsmergedcode, \tsdemo, \tsresult and \tsexec).

Note: From scontents, $\langle \text{st-name} \rangle \langle \text{index} \rangle \text{ed}$ (The code is stored in a sequence variable). It is possible to store as many code snippets as needed under the same name. The first one will be $\langle \text{index} \rangle \rightarrow 1$, the second 2, and so on.

2.2 Code Display/Demo

\tscode* \tsdemo* \tsresult*		<pre>\tscode* [(code-keys)] {(st-name)} [(index)] \tsdemo* [(code-keys)] {(st-name)} [(index)] \tsresult* [(code-keys)] {(st-name)} [(index)]</pre>
updated: updated:	2024/01/06 2025/04/29	<pre>\tscode* just typesets (st-name) (created with codestore), in verbatim mode and syntax highlight (from listings package [2]). The non-star version centers it and use just half of the base line. The star version uses the full text width. \tsdemo* first typesets (st-name), as above, then executes it. The non-start version place them side-by-side, whilst the star version places one following the other. (new 2024/01/06) \tsresult* only executes it. The non-start version centers it and use just</pre>

half of the base line, whilst the star version uses the full text width. only *executes* it. The non-start version centers it and use just half of the base line, whilst the star version uses the full text width.

Note: (from stcontents package) $\langle \text{index} \rangle$ can be from 1 up to the number of stored codes under the same $\langle \text{st-name} \rangle$. Defaults to 1.

Note: All are executed in a local group which is discarded at the end. This is to avoid unwanted side effects, but might disrupt code execution that, for instance, depends on local variables being set. That for, see **\tsexec** below.

For Example:

```
IATEX Code:
\begin{codestore}[stmeta]
    Some \LaTeX~coding, for example: \ldots.
\end{codestore}
This will just typesets \tsobj[key]{stmeta}:
\tscode*[codeprefix={Sample Code:}] {stmeta}
and this will demonstrate it, side by side with source code:
\tsdemo[numbers=left,ruleht=0.5,
    codeprefix={inner sample code},
    resultprefix={inner sample result}] {stmeta}
```

$\amalg T_{\!E\!} X \ {\rm Result:}$

This will just typesets stmeta:

Sample Code:

Some \LaTeX[~]coding, for example: \ldots.

and this will demonstrate it, side by side with source code:

	inner sample code	inner sample result
1	Some \LaTeX~coding, for example: \ldots.	Some $L^{T}EX$ coding, for example:

<u></u>	\tamaged at [/and have\] [/at more index list\]					
\tsmergedcode*	$\timestimestimestimestimestimestimestimes$					
new: 2025/04/29	This will typeset (as \tscode) the merged contents from $\langle st-name-index list \rangle$. The list syntax comes from <i>scontents</i> (command \mergesc), where it is possible to refer to a single index { $\langle st-name A \rangle$ } [$\langle index \rangle$], a index range { $\langle st-name B \rangle$ } [$\langle index A-index B \rangle$], or all indexes from a $\langle st-name \rangle$, { $\langle st-name C \rangle$ } [$\langle 1-end \rangle$]. The special index $\langle 1-end \rangle$ refers to all indexes stored under a given $\langle st-name \rangle$.					
	<pre>Note: The brackets aren't optional. For instance \tsmergedcode* [{code-keys}] { {{st-name A}} [{index}], {{st-name B}} [{indexA-indexB}], {{st-name C}} [{1-end}] }</pre>					
\tsexec	\tsexec $\{\langle \mathtt{st-name} \rangle\} [\langle \mathtt{index} \rangle]$					
new: 2025/04/29	Unlike the previous commands which are all executed in a local group (discarded at the end this will execute the code stored at $(st-name) [(index)]$ in the current LATEX group.					
	2.2.1 Code Keys					
\setcodekeys	\setcodekeys $\{\langle code-keys \rangle\}$					
	One has the option to set (code-keys) per \tscode, \tsmergedcode, \tsdemo and \tsresult call (see 2.2), or globally, better said, in the called context group.					
	N.B.: All \tscode and \tsdemo commands create a local group in which the (code-keys) are defined, and discarded once said local group is closed. \setcodekeys defines those keys in the <i>current</i> context/group.					
\setnewcodekey	$\verb+setnewcodekey { (new-key) } { (code-keys) }$					
new: 2025-05-01	This will define a new key $\langle new-key \rangle$, which can be used with $tscode$, $tsmergedcode$, $tsdemo$ and $tsresult$. $\langle code-keys \rangle$ can be any of the following ones, including other $\langle new-key \rangle$ s. Be careful not to create a definition loop.					

settexcs	settexcs, settexcs2, settexcs3 and settexcs4					
texcs	texcs, texcs2, texcs3 and texcs4 texcsstyle, texcs2style, texcs3style and texcs4style					
texcsstyle						
updated: 2025-05-01	Those define sets of $L^{A}T_{E}X$ commands (csnames), the set variants initialize/redefine those sets (an empty list, clears the set), while the others extend those sets. The style ones redefines the command display style (an empty $\langle value \rangle$ resets the style to it's default).					
aathound	setkeywd, setkeywd2, setkeywd3 and setkeywd4					
setkeywd keywd	keywd, keywd2, keywd3 and keywd4					
keywdstyle	keywdstyle, keywd2style, keywd3style and keywd4style					
updated: 2025-05-01	Same for other <i>keywords</i> sets.					
actomph	setemph, setemph2, setemph3 and setemph4					
setemph emph	emph, emph2, emph3 and emph4					
emphstyle	emphstyle, emph2style, emph3style and emph4style					
updated: 2025-05-01	for some extra emphasis sets.					
letter	letter and other					
other	These allow to redefine what a letter or other are (they correspond to the alsoletter and					
new: 2025-05-13	alsoother keys from listings). The default value for the letter includes (sans the comma)					
	© : _, whilst other default value is an empty list.					
	Note: You might want to consider setting letter to just letter= $\{\mathcal{Q}, _\}$ so you don't have to list all variants, but just the base name of a function.					
numbers	numbers and numberstyle					
numberstyle	numbers possible values are none (default) and left (to add tinny numbers to the left of the					
	listing). With numberstyle one can redefine the numbering style.					
stringstyle	stringstyle and commentstyle					
codestyle	to redefine strings and comments formatting style.					
bckgndcolor	bckgndcolor					
	to change the listing background's color.					
codeprefix	codeprefix and resultprefix					
resultprefix	those set the codeprefix (default: ${\rm IAT}_{E\!}X$ Code:) and result refix (default: ${\rm IAT}_{E\!}X$ Result:)					
parindent	parindent					
	Sets the indentation to be used when 'demonstrating' IAT_EX code (\tsdemo). Defaults to whatever value \parindent was when the package was first loaded.					
ruleht	ruleht					
	When typesetting the 'code demo' (\tsdemo) a set of rules are drawn. The Default, 1, equals					
	to \arrayrulewidth (usually 0.4pt).					
basicstyle	basicstyle					
new: 2023/11/18	Sets the base font style used when typesetting the 'code demo', default being \footnotesize \ttfamily					

3 codedescribe Package

This package aims at minimizing the number of commands, with object kind (if a macro, or a function, or environment, or variable, or key ...) as a parameter, allowing for a simple extension mechanism: other object types can be easily introduced without having to change, or add commands.

3.1 Package Options

- nolisting it will suppress the *codelisting* package load. In case it isn't needed or another listing package will be used.
- base skip Changes the base skip, all skips (used by the environments at 3.3) are scaled from this. It defaults to font size at load time.

3.2 Object Type keys

 $\langle obj-types \rangle$ defines the applied format, which is defined in terms of $\langle format-groups \rangle$ wich defines a formatting function, font shape, bracketing, etc. to be applied.

3.2.1 Format Keys

Those are the primitive $\langle \texttt{format-keys} \rangle$ used when (re)defining $\langle \texttt{format-groups} \rangle$ and $\langle \texttt{obj-types} \rangle$ (see 3.2.4):

meta	to typeset between angles,
xmeta	to typeset *verbatim* between angles,
verb	to typeset *verbatim*,
xverb	to typeset *verbatim*, suppressing all spaces,
code	to types et *verbatim*, suppressing all spaces and replacing a TF by $\underline{\mathrm{TF}},$
nofmt	in case of a redefinition, to remove the 'base' formatting,
slshape	to use a slanted font shape,
itshape	to use an italic font shape,
noshape	in case of a redefinition, to remove the 'base' shape,
lbracket	defines the left bracket (when using $\verb+tsargs+$). Note: this key must have an associated value,
rbracket	defines the right bracket (when using $\verb+tsargs+$). Note: this key must have an associated value,
color	defines the text color. Note: this key must have an associated value (a color, as understood by <i>xcolor</i> package).

3.2.2 Format Groups

Using $\langle \text{defgroupfmt} (\text{see 3.2.4}) \rangle$ one can (re)define custom $\langle \text{format-groups} \rangle$. The following ones are pre-defined:

meta	which sets meta and color
verb	which sets color
oarg	which sets meta and color
code	which sets code and color
syntax	which sets color
keyval	which sets ${\it slshape} {\rm ~and} {\rm ~color}$
option	which sets color
defaultval	which sets color
env	which sets ${\it slshape} {\rm ~and} {\rm ~color}$
pkg	which sets <i>slshape</i> and <i>color</i>

Note: color was used in the list above just as a 'reminder' that a color is defined/associated with the given group, it can be changed with \defgroupfmt.

3.2.3 Object Types

Object types are the $\langle keys \rangle$ used with tsobj (and friends, see 3.4) defining the specific formatting to be used. With defobjectfmt (see 3.2.4) one can (re-)define custom $\langle obj-types \rangle$. The predefined ones are:

based on (group) meta
based on (group) verb plus verb or xverb
based on (group) meta plus brackets
based on (group) oarg plus brackets
based on (group) code
based on (group) syntax
based on (group) keyval
based on (group) option
based on (group) defaultval
based on (group) env
based on (group) pkg

3.2.4 Customization

To create user defined groups/objects or change the pre-defined ones:

\defgroupfmt	$\texttt{defgroupfmt} \{ \langle \texttt{format-group} \rangle \} \{ \langle \texttt{format-keys} \rangle \}$						
$\frac{1}{10000000000000000000000000000000000$							
For example, one can redefine the code group standard color with \defgroupfmt{code} and all obj-types based on it will be typeset in red (in the standard case: code, macro function objects).							
\defobjectfmt	$\label{eq:linear} $$ \eqref{linear} f(obj-type) } {\format-group} {\format-keys} $$$						
new: 2023/05/16	$\langle obj-type \rangle$ is the name of the new $\langle object \rangle$ being defined (or redefined), $\langle format-group \rangle$ is the base group to be used (see 3.2.2). $\langle format-keys \rangle$ (see 3.2.1) allow for further differentiation.						
	For instance, the many optional $\langle \ast \texttt{arg} \rangle$ are defined as follow:						
<pre>\colorlet {ccodedesc_oarg_color} { gray!90!black }</pre>							
<pre>\defgroupfmt {oarg} { meta , color=ccodedesc_oarg_color }</pre>							

\defobjectfmt	{oarg}	{oarg}	{	lbracket={[}	,	rbracket={]}	}
\defobjectfmt	{parg}	{oarg}	{	<pre>lbracket={(}</pre>	,	<pre>rbracket={)}</pre>	}
\defobjectfmt	{xarg}	{oarg}	{	lbracket={<}	,	<pre>rbracket={>}</pre>	}

Environments 3.3

codedescribe

new:

\begin{codedescribe} [(obj-keys)] {(csv-list)}

\end{codedescribe}

2023/05/01 updated: 2023/05/01 updated: 2024/02/16 NB: a note example

This is the main environment to describe Commands, Variables, Environments, etc. (csv-list) items will be listed in the left margin. The optional (obj-keys) defaults to just code, it can be any object type as defined at 3.2.3 (and 3.2.4), besides the following keys:

new	To add a <i>new</i> line.
update	To add an <i>updated</i> line.
note	To add a <i>NB</i> line.
rulecolor	For instance \begin{codedescribe}[rulecolor=white] will suppress the rules.
EXP	A star \bigstar will be added to all items, signaling the commands are fully expandable.
rEXP	A hollow star \doteqdot will be added to all items, signaling the commands are restricted expandable.

Note: The keys new, update and note can be used multiple times. (2024/02/16)

codesyntax \begin{codesyntax}

. .

\end{codesyntax}

The codesyntax environment sets the fontsize and activates \obeylines, \obeyspaces, so one can list macros/cmds/keys use, one per line.

> Note: codesyntax environment shall appear only once, inside of a codedescribe environment. An error will be raised if called outside. Take note, as well, this is not a verbatim environment!

For example, the code for *codedescribe* (previous entry) is:

 IAT_{FX} Code:

```
\begin{codedescribe}[env,new=2023/05/01,update=2023/05/01,note={a note example},update
      =2024/02/16]{codedescribe}
  \begin{codesyntax}
   \tsmacro{\begin{codedescribe}}[obj-type]{csv-list}
    \ldots
   \tsmacro{\end{codedescribe}}{}
 \end{codesyntax}
 This is the main
\end{codedescribe}
```

describelist \begin{describelist} [(item-indent)] {(obj-type)} describelist* \describe {(item-name)} {(item-description)} \describe {(item-name)} {(item-description)}

\end{describelist}

. . .

This sets a *description* like 'list'. In the non-star version the $\langle items-name \rangle$ will be typeset on the marginpar. In the star version, (item-description) will be indented by (item-indent) (defaults to: 20mm). (obj-type) defines the object-type format used to typeset (item-name).

\describe $\det \{ \langle \text{item-name} \rangle \} \{ \langle \text{item-description} \rangle \}$

This is the describelist companion macro. In case of the describe*, (item-name) will be typeset in a box (item-ident) wide, so that (item-description) will be fully indented, otherwise (item-name) will be typed in the marginpar.

> Note: An error will be raised if called outside of a describelist or describelist* environment.

3.4 Typeset Commands

Note that, in the following commands, $\langle \texttt{obj-type} \rangle$ refers to any object type defined in 3.2.3 and 3.2.4.

\typesetobj \tsobj	<pre>\typesetobj [(obj-type)] {(csv-list)} \tsobj [(obj-type)] {(csv-list)}</pre>						
updated: 2025/05/29	This is the main typesetting command, each term of $\langle csv-list \rangle$ will be separated by a comma and formatted as defined by $\langle obj-type \rangle$ (defaults to <i>code</i>). $\langle obj-type \rangle$ can be any object from 3.2.3 (or 3.2.4) and the following keys:						
	mid sep	To change the item separator. Defaults to a comma, can be anything.					
	sep	To change the separator between the last two items. Defaults to "and".					
	comma	To set the separator between the last two items to a comma.					
	bnf or	To produce a bnf style or list, like [abc xdh htf hrf].					
	meta or	To produce a bnf style or list between angles, like $\langle abc xdh htf hrf \rangle$.					
	par or	To produce a bnf style or list between parentheses, like $(abc xdh htf hrf)$.					
\typesetargs \tsargs	[(obj-type)] {(csv-list)} -type)] {(csv-list)}						
	$\{\langle \texttt{arg1} \rangle\} \{\langle \texttt{arg}$	peset $\langle csv-list \rangle$ as a list of parameters, like $[\langle arg1 \rangle] [\langle arg2 \rangle] [\langle arg3 \rangle]$, or 2 \rangle { $\langle arg3 \rangle$ }, etc. $\langle obj-type \rangle$ defines the formating AND kind of brackets used or optional arguments (oarg), {} for mandatory arguments (marg), and so on.					
\typesetmacro \tsmacro	<pre>cro \typesetmacro {\macro-list\} [\langle oargs-list\] {\margs-list\} \tsmacro {\macro-list\} [\langle oargs-list\] {\margs-list\}</pre>						
	These are just	t a short-cut for					
	\tsobj[code]	<pre>[macro-list} \tsargs[oarg]{oargs-list} \tsargs[marg]{margs-list}.</pre>					
\typesetmeta \tsmeta	\typesetmeta \tsmeta { <nam< th=""><th></th></nam<>						
	These will just	hese will just typeset $\langle name \rangle$ between left/right 'angles' (no other formatting).					
\typesetverb \tsverb	[(obj-type)] {(verbatim text)} -type)] {(verbatim text)}						
	ference with	batim text) as is (verbatim). (obj-type) defines the used format. The dif- tsobj [verb]{something} is that (verbatim text) can contain commas (which, uld be interpreted as a list separator in \tsobj.					
		Note: This is meant for short expressions, and not multi-line, complex code (one is better of, then, using 2.2). (verbatim text) must be balanced ! otherwise, some low level T _E X errors may pop out.					

3.5 Note/Remark Commands

Typesets a small note at the margin.

tsremark $\begin{tsremark} [(NB)] \$

\end{tsremark}

The environment body will be typeset as a text note. (NB) (defaults to Note:) is the note begin (in boldface). For instance:

LATEX Code:

Sample text. Sample test.
\begin{tsremark}[N.B.]
This is an example.
\end{tsremark}

LATEX Result:

Sample text. Sample test. N.B. This is an example.

3.6 Auxiliary Commands and Environment

In case the Document Class being used redefines the \maketitle command and/or abstract environment, alternatives are provided (based on the article class).

\typesettitle \tstitle	$\label{eq:linear} $$ $$ $$ $$ $$ $$ $$ $$ $$ $$ $$ $$ $$$		
	title	The title.	
	author	Author's name. It's possible to use the \footnote command in it.	
	date	Title's date.	
tsabstract	\begin{tsabstract}		
	 \end{tsabstract}		
	This is the abstract environment from the article class.		

\typesetdate \tsdate		51
new:	2023/05/16	This provides the current date (Month Year, format).
