

# The pgfkeysearch Package

## A Search Extension for pgfkeys

### Version 1.2

Alceu Frigeri\*

January 2024

#### Abstract

The command `\pgfkeysvalueof`, unlike other `\pgfkeys` commands, doesn't have a `.unknown` handler, or offers the option to search for a key. That's exactly the aim of this, by having a way to find a key in a given path (or collection of paths).

## 1 Searching for a key

---

<code>\pgfkeyssearchvalueof</code>	<code>\pgfkeyssearchvalueof {⟨path-list⟩} {⟨key⟩} {⟨macro⟩}</code>
<code>\pgfkeyssearch</code>	<code>\pgfkeyssearch {⟨path-list⟩} {⟨key⟩} {⟨macro⟩}</code>
<code>\pgfkeyssearchvalueofTF</code>	<code>\pgfkeyssearchvalueofTF {⟨path-list⟩} {⟨key⟩} {⟨macro⟩} {⟨if-found⟩} {⟨if-not⟩}</code>
<code>\pgfkeyssearchTF</code>	<code>\pgfkeyssearchTF {⟨path-list⟩} {⟨key⟩} {⟨macro⟩} {⟨if-found⟩} {⟨if-not⟩}</code>

---

update: 2024/01/11

`⟨path-list⟩` is a comma separated list (clist) of paths (can be a single one). `⟨key⟩` is the desired key and `⟨macro⟩` is the macro/command that will receive (store) the key value (if one was found). For instance, given a path `/A/B/C/D` it will look first at `/A/B/C/D/⟨key⟩`, then `/A/B/C/⟨key⟩`, and so on, until `/A/⟨key⟩`, stopping at the first hit, returning the value found in the `⟨macro⟩`. The branch version will also execute either `⟨if-found⟩` or `⟨if-not⟩`.

**Note:** `\pgfkeyssearch` and `\pgfkeyssearchvalueof` are aliases to each other. Same with `\pgfkeyssearchvalueofTF` and `\pgfkeyssearchTF`.

**Note:** These commands aren't expandable, that's the reason to have them storing the key value in a macro and not just placing the found value in the input stream.

LaTeX Code:

LaTeX Result:

---

```
\pgfkeys{/tikz/A/.cd,
keyA/.initial={keyA at /tikz/A},
keyB/.initial={keyB at /tikz/A},
B/.cd,
keyA/.initial={keyA at /tikz/A/B},
keyC/.initial={keyC at /tikz/A/B},
C/.cd,
keyX/.initial={keyX at /tikz/A/B/C} }
\pgfkeyssearchvalueof{/tikz/A/B/C}{keyA}{\VALkeyA}
\pgfkeyssearchvalueof{/tikz/A/B/C}{keyB}{\VALkeyB}
\pgfkeyssearchvalueof{/tikz/A/B/C}{keyC}{\VALkeyC}
\pgfkeyssearchvalueof{/tikz/A/B/C}{keyX}{\VALkeyX}
I got for keyA: \textbf{\VALkeyA} \par
I got for keyB: \textbf{\VALkeyB} \par
I got for keyC: \textbf{\VALkeyC} \par
I got for keyX: \textbf{\VALkeyX} \par
```

---

```
I got for keyA: keyA at /tikz/A/B
I got for keyB: keyB at /tikz/A
I got for keyC: keyC at /tikz/A/B
I got for keyX: keyX at /tikz/A/B/C
```

## 2 Expl3 Base Commands

---

<code>\pgfkeysearch_multipath_keysearch:nnnTF</code>	<code>\pgfkeysearch_multipath_keysearch:nnnTF</code>	<code>{\path-list}{\key}{\macro}</code>
<code>\pgfkeysearch_keysearch:nnnTF</code>	<code>{\if-found}{\if-not}</code>	
	<code>\pgfkeysearch_keysearch:nnnTF</code>	<code>{\single-path}{\key}{\macro}{\if-found}</code>
	<code>{\if-not}</code>	

These are the *Expl3* version of it, for package writers. In fact, `\pgfkeysearchvalueof`, `\pgfkeysearch`, `\pgfkeysearchvalueofTF` and `\pgfkeysearchTF` are just wrappers to `\pgfkeysearch_multipath_keysearch:nnnTF`. The `\pgfkeysearch_keysearch:nnnTF` is the single path version and it's slightly faster than the more generic multi-path version (for a single path search, of course), given that `\pgfkeysearch_multipath_keysearch:nnnTF` calls `\pgfkeysearch_keysearch:nnnTF` for each path in `\path-list`.
